Prompt Engineering ?

Prompt Engineering

Prompt engineering involves designing and refining language model prompts to achieve specific desired outputs. It includes crafting prompts that provide clear instructions, context, or constraints to guide the model's responses.

Prompt Engineering

In other words, it involves taking a *prompt* and manipulating it to get a type of desired output.

Adding context to the prompt, output instructions or response constraints are all examples of prompt engineering.

Prompting seems to be difficult for some machine learning researchers to understand. This is not surprising because prompting is not machine learning. Prompting is the opposite of machine learning.

Importance of Prompt Engineering ?

- **Reduces Ambiguity** → Clarifies user intent, leading to more precise and relevant outputs from AI models.

Importance of Prompt Engineering ?

- **Improves User Experience** → Provides users with more accurate and helpful responses, improving satisfaction and engagement.

Helps users get better answers, boosting their satisfaction and engagement.

Why Prompt Engineering works ?

- LLMs have been trained with extensive data and human annotated prompts.
- Hence when we use prompts to define role, details and intent, it yields better results
- Minimizes misunderstandings and errors by clearly defining the input parameters and expected output.

The Science of Prompt Engineering

Prompt engineering is the art of crafting precise prompts to guide the AI into delivering a desired output.

Importance in Domain Adaptation:

- **Targeted Responses** → Ensures responses are not only accurate but also contextually relevant.
- **Leverage Domain Knowledge** → Incorporates specific terminology and workflows unique to the domain.

Different prompting Strategies:

- **Instruction-based** → Direct and explicit instructions for tasks.
- **Contextual Clues** → Incorporating specific context to guide the AI's focus.

- **Few-shot Prompting** → Providing a few examples to set a response pattern.
- **Fine-tuning with Examples** → Intensive example-based training to refine model understanding.

Impact of Prompt Engineering → Enhanced model performance, reliability, and domain-specific accuracy.

Examples : Zero Shot Prompting

- Large-scale training makes these models capable of performing some tasks in a **"zero-shot"** manner.
- Zero-shot prompting means that the prompt used to interact with the model **won't contain examples** or demonstrations.
- The zero-shot prompt directly instructs the model to perform a task **without any additional examples to steer it.**

Examples: Few Shot Prompting

- Few-shot prompting can be used as a technique to **enable in-context learning** where we provide demonstrations in the prompt to steer the model to better performance.
- The demonstrations serve as **conditioning for subsequent examples** where we would like the model to generate a response.

A "whatpu" is a small, furry animal native to Tanzania. An example of a sentence that uses the word whatpu is:

We were traveling in Africa and we saw these very cute whatpus.

To do a "farduddle" means to jump up and down really fast. An example of a sentence that uses the word farduddle is:

Sure, here's an example sentence using the word "farduddle":

The children were so excited about their new puppy that they couldn't stop farduddling in the living room.

Chain of Thoughts

- chain-of-thought (CoT) prompting enables **complex reasoning capabilities through intermediate reasoning steps**.
- You can **combine it with few-shot prompting** to get better results on more complex tasks that require reasoning before responding.

Standard Prompting

Model Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: The answer is 11.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

Model Output

A: The answer is 27. ❌

Chain-of-Thought Prompting

Model Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: Roger started with 5 balls. 2 cans of 3 tennis balls each is 6 tennis balls. $5 + 6 = 11$. The answer is 11.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

Model Output

A: The cafeteria had 23 apples originally. They used 20 to make lunch. So they had $23 - 20 = 3$. They bought 6 more apples, so they have $3 + 6 = 9$. The answer is 9. ✅

True.

The odd numbers in this group add up to an even number: 4, 8, 9, 15, 12, 2, 1.

Why Fine-tuning ?

What is LLM Fine-Tuning?

- Fine-tuning is the process of adjusting the parameters of a pre-trained large language model to a **specific task or domain**
- The amount of fine-tuning required depends on the complexity of the task and the size of the dataset

Fine-tuning involves updating a language model's parameters, while prompt engineering entails temporary learning during inference.

Jeff Dean (@JeffDean) ✓

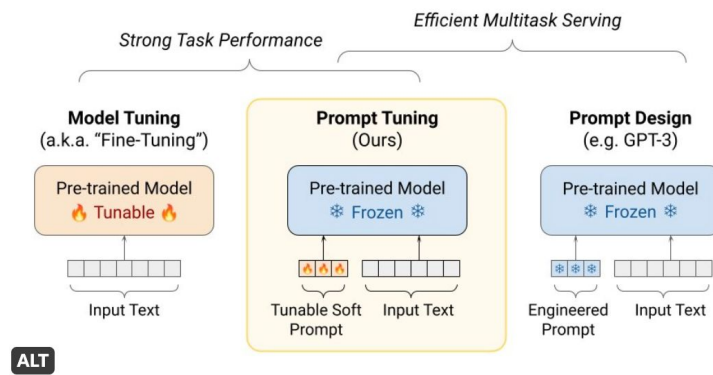

@JeffDean

Prompt tuning is a clever way to use the fixed weights of a large, pre-trained language model for many different tasks. Instead of fine tuning (adjusting the parameter values), you hold those fixed and optimize a fixed size vector representation as an input for the task.

Google AI @GoogleAI · Feb 10, 2022

Fine-tuning pre-trained models is common in NLP, but forking the model for each task can be a burden. Prompt tuning adds a small set of learnable vectors to the input and can match fine-tuning quality while sharing the same frozen model across all tasks. goo.gle/3Bch2IL

Catastrophic Forgetting: The Curse of Fine-Tuning

Fine-tuning, while enhancing performance on new tasks, can cause the model to forget previously learned skills.

What is Catastrophic Forgetting?

- Imagine training an LLM to be a master chef (general knowledge).
- You then fine-tune it for baking (specific task).
- While it excels at baking, it might forget how to cook other dishes (catastrophic forgetting).

Introducing PEFT

PEFT

Parameter-Efficient Fine-Tuning (PEFT) methods enable efficient adaptation of pre-trained language models (PLMs) to various downstream applications without fine-tuning all the model's parameters.

Fine-tuning large-scale PLMs is often prohibitively costly. In this regard, PEFT methods only fine-tune a small number of (extra) model parameters, thereby greatly decreasing the computational and storage costs. Recent State-of-the-Art PEFT techniques achieve performance comparable to that of full fine-tuning.

LLM Agents

How AI Agents Work?

AI agent = Acts Autonomously in an environment

Takes information from its surroundings, make decisions based on that data, and act to transform those circumstances

AI Agents vs Single Prompted LLM

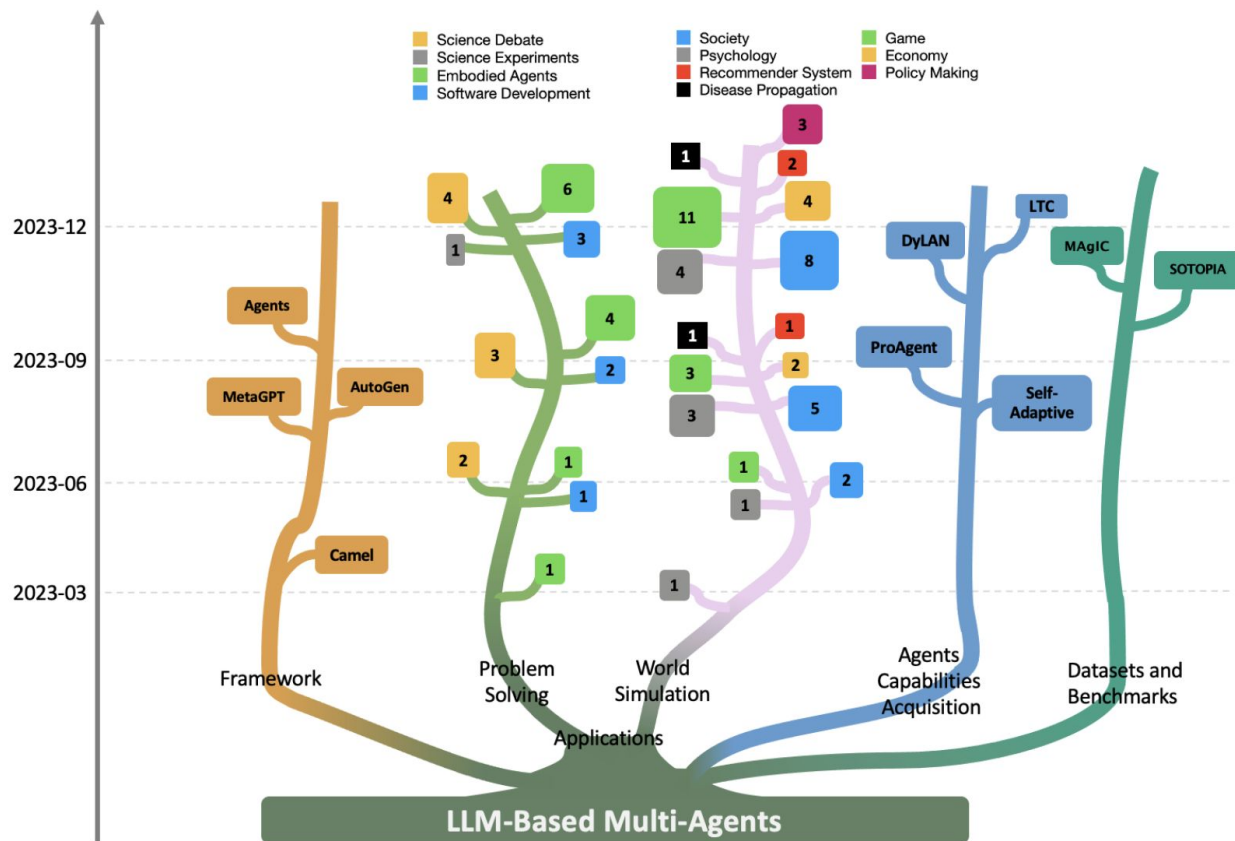

Task Flexibility: Single-prompt LLMs require precise prompts and are hard to adjust when task requirements change. AI Agents can adapt by breaking tasks into subtasks without extensive prompt engineering.

Context Retention: Single-prompt LLMs may lose context between interactions. AI Agents maintain context across interactions, allowing them to stay on track.

Specialization: Single-prompt LLMs need extensive fine-tuning for domain expertise. AI Agents can be a team of specialized models, each focused on specific tasks.

Internet Access: Single-prompt LLMs rely on a static knowledge base, which may be outdated. AI Agents can access the internet, providing up-to-date information for better decision-making.

Multi-agent LLMs are trending right now...
